

ATTACHMENT OF FLEXIBLE REVEAL STRIPS TO FORMS

When shapes are required for radius or Sonotube applications, Greenstreak can custom cut nearly any size of flexible reveal strip out of our urethane rubber material. This material is flexible, highly reusable, and very easy to use. Please note that flexible reveal strips are not suggested in high temperature concrete applications (140+ degrees F). Excessive temperatures may cause the reveal strips to sag or bend between fastening points.

Greenstreak flexible reveal strips are provided in 10' lengths, formed to the profile to match the requirements of each job. This material is not stocked and generally takes two weeks to produce.

Greenstreak's flexible reveal strips can be easily attached to almost any type of form work by using appropriate length drywall or wood screws. Adhesives may be used, but tend to be messy and may not have as much holding power as a mechanical fastener. Reveal strips shall be fastened to the form work every 18" to 24" on center. Fasteners should be screwed through the flexible reveal strips at the centerline of the strip. Due to the flexible urethane material, the rubber will partially close over the fastener heads leaving a dimpled surface, which will provide the best finish.

At locations where two reveal strips intersect, it is necessary to bevel the face of the intersecting reveal strip (the non-continuous strip) to match the draft angle of the reveal strip it is intersecting (the continuous strip). This provides a nice, continuous reveal strip pattern, without concrete leaking between intersecting reveals.

Greenstreak's Form Release 7000 can be used to promote easy stripping of flexible reveal strips. Release agents containing diesel fuel, fuel oil, or other petroleum-based products may decrease the life of the reveal strip.

Care should be taken not to drop concrete directly onto a reveal strip. This may damage, bow, or misplace the reveal strip. Forms may be stripped using standard stripping times and procedure.
